How to stream audio from pc to phone via usb. How to stream audio from android to pc via wifi. How to stream audio from android to pc. Stream audio from pc to android via wifi or usb. How to stream audio from phone to pc windows 10 via usb.

Sometimes, you want to play that fantastic PC game while you're on the go. There are ways to do so that take some of the hurdles out of setting it up while still offering you ways to play your favorite big games on the go. Here are some different methods to stream PC games to Android and other devices. Nopparat Jaikla / EyeEm / Getty Images If you have a PC with an Nvidia graphics card and an Nvidia Shield device, GameStream is the first method you should check out. It's supported natively on Shield devices, and boasts full controller support, with the ability to play games locally or over the internet. Some laptops with hybrid graphics solutions might have issues, but if you have a desktop PC and the Shield Tablet, Portable, or Shield TV, then this is the way to go. If you have an Nvidia-powered PC but not an Nvidia Shield device, there is an open implementation of GameStream called Moonlight that you could use. Even if you have GameStream, the support for virtual controls here might be useful. A third-party, unofficial solution is going to run into issues because it's an outside implementation. Do not expect the same smoothness or performance that you would get through a typical GameStream device. Still, given how GameStream is well-regarded as a way to stream PC games, this is an excellent option if you use Nvidia products on your PC. Another Nvidia Shield-exclusive product, this allows you to stream games much like the old school OnLive technology did. But if you don't have a powerful gaming computer — or lack one at all. A subscription fee gets you a selection of games you can stream at your leisure, and the performance is quite good. You can even buy some newer titles outright and get PC keys for them to own permanently, not just on the service, including The Witcher 3. It seems to be the future for big games like this, as you can play them at an excellent quality, and streaming video compression is becoming less and less of a factor than ever before. Check it out if you have the capability. If you don't use Nvidia technology, or if you have issues with GameStream, Kinoni's technology works quite well for playing games remotely. What's great about the PC server is that it has a virtual Xbox 360 controller driver that it installs, so you can easily use a gamepad with your Android device on the go and play your favorite PC games without much issue or setup hassle. Otherwise, there are virtual buttons you can set up. The controller can be a bit fussy with normal PC usage, though. Kainy is another excellent way to stream PC games, but it is a bit trickier to use than KinoConsole. It doesn't have quite as appealing of an interface for browsing games that Kinoni's software does. And using a controller is a bit trickier to handle than KinoConsole's virtual Xbox 360 controller driver. But if you don't mind diving deep, deep into the settings, and messing around with various configurations and setting buttons up yourself, you'll find yourself with a rewarding product that could work quite well. It comes with a demo version and an ad-supported version that you can try before you go for the premium version. Remotr is another useful tool for remote playing PC games, and its hook is that it features intuitive touch controls, with touchscreen button presets that can let you play if you don't have a controller handy. You can use a gamepad if you want, but this might be the way to go if you don't have a controller or the other methods give you issues. Splashtop's remote streaming has been around for a while and focused on low-latency remote computing along with the sound. It is excellent for PC gaming, though you will need the Productivity Pack in-app subscription to unlock the gamepad functionality. Still, this has always worked pretty well, and without much issue, and it might just be the solution you need to play games from your PC over the internet. Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! Reader Jay wants to know how many USB "splitters" he can use with his desktop. The system has four USB ports in the back and two in the front. Jay says he's already using one splitter, but needs two additional USB ports. Holy mackerel, Jay, how many devices do you have? (I'm a power user myself, and only four of my desktop's six ports are occupied.) To answer your question, yes, it's safe to add another splitter (which, although an apt description, is traditionally known as a USB hub). In fact, a PC is theoretically capable of accommodating up to 127 USB ports. However, the reality is a bit different. By "splitting" a USB port, you reduce the power available to the newly added ports. Whether or not that's a problem depends on the kinds of devices you plug in, but I strongly recommend using only powered USB hubs. They cost a little more, and force you to find yet another free AC outlet, but they virtually eliminate the issues that tend to arise with non-powered hubs. I also recommend plugging each hub directly into one of your PC's built-in USB ports. In other words, don't daisy-chain them. And if you use an external hard drive, plug that into a built-in (i.e. non-hub) port as well. When it comes to your data, it's not wise to risk any kind of power fluctuation. People often "ether" their computers to their smartphones, sending their computer's network traffic over the device's cellular data connection. "Reverse tethering" is the opposite — tethering your Android smartphone or tablet to your PC to use your PC's Internet connection. This method requires a rooted Android and a Windows PC, but it's very easy to use. If your computer has Wi-Fi, it may be easier to create a Wi-Fi hotspot using a utility like Connectify instead. Prerequisites Before using this utility, you'll have to enable USB debugging on your Android phone or tablet — open the Settings screen, tap Applications, tap Development, and tap the USB Debugging checkbox. You will probably also want to disable SuperUser access notifications, or you'll constantly see the SuperUser notification. Launch the SuperUser app on your device, open its menu, tap Preferences, and uncheck the Notifications check box under Notifications. If you don't see the SuperUser app on your Android, your device probably isn't rooted. You'll also need your device's USB driver installed on your computer. You can get this from your device's manufacturer or try downloading a generic driver from Google. Android Reverse Tethering Tool Android Reverse Tethering is a Windows utility that uses ADB — also known as Android Debug Bridge — to share your computer's Internet connection with your Android over USB. It includes its own copy of ADB, so you don't even need the Android SDK installed on your computer. You can download it from here — scroll down and click the latest ReverseTethering.zip file in the Attached Files section. Extract the downloaded.zip file and run the AndroidTool.exe application inside its folder. Connecting Plug your Android smartphone or tablet into your computer with its USB cable, select it from the Select a device drop-down box, and click the Connect button in the Android Reverse Tethering Tool application. It will connect to your Android and install the required software (Busbox and Redsocks) on it. Tap the Allow button in the SuperUser prompt to allow the USB Tunnel tool on your device. If you encounter a crash, close the Android Reverse Tethering Tool application and start again. You can also try clicking the Kill ADB button on the Tools tab to relaunch the ADB process. You'll see a connection notification when the tool establishes a connection. Usage After the setup process is complete, you can open apps on your device and use the Internet. Your Android will forward network traffic over the USB cable to your computer, where it will take advantage of your computer's Internet connection. The Windows application shows information about the forwarded connections. Some applications may complain that you don't have an Internet connection, although most (with the notable exception of Google Play app downloads) will work properly. You can work around this problem by connecting to a 3G or Wi-Fi connection before activating reverse tethering — Android will think you have a normal connection, although all data will be sent through your USB cable and not over the air. By Larry Amon i laptop with microphone image by patrimonio designs from Fotolia.com PC microphones are inherently cheap. They are not made for recording a rock concert, just for capturing your voice for minimal playback, as part of a Voice over Internet Protocol (VoIP) system or for software that takes voice commands. Even with an especially inexpensive computer microphone, you can use some standard recording techniques to improve the audio. Of course, it will also help a bit if you use a higher quality microphone with your computer. Install a better sound card if possible, since a higher quality card can make a big difference. Open the computer case and remove the old sound card. Insert a new card. Close the case, restart the computer and point Windows to the drivers when prompted. Plug the microphone into the mic input jack on your new card. Don't touch the microphone. Find a stand on which to set the microphone and don't hold it with your hand, since that is likely to add extra sounds to your recording. Use a screen. Buy a windscreen and set it up in front of the microphone. Windscreens keep some of the spit and pops from coming through. Position the microphone somewhat close to where you'll be speaking. Your mouth shouldn't be so close that your lips might touch the microphone, but if you speak more than a foot away, the microphone will probably not pick up your voice as well.
